THE KEY TO UNLOCKING SECURE ROLE SOLUTIONS

PULSE serves as the live security heart rate monitor for your enterprise SAP landscape.

Operating directly within the Cortex Suite, **PULSE** transforms identity management and emergency access into a dynamic, heavily audited workflow. By replacing manual spreadsheet reviews with automated provisioning and continuous risk governance, **PULSE** eliminates human error, safeguards IT margins, and maintains a permanent, audit-ready corporate footprint.

Streamlining Access Provisioning ensures effortless, secure delivery of system permissions across the complete identity lifecycle for joiners, movers, and leavers. **PULSE** replaces static forms with an action-driven request engine supporting user creation, role assignment, account locking, and secure password resets. A sequential provisioning worker halts at the first failure to prevent cascading errors, while secure credential dispatch auto-generates initial passwords via native SAP interfaces without storing sensitive data in audit logs.

Automating Routine Access Reviews combats review fatigue by replacing tedious spreadsheets with exception-based logic that alerts business leads only to high-risk or out-of-policy access. All pending decisions, historical logs, and workflow stages aggregate into a unified approver workspace without requiring multiple transaction codes. Administrators can architect granular approval chains featuring configurable quorums, automated escalations, and mandatory justification enforcement to guarantee complete audit transparency for every submission or rejection.

Managing Elevated Access Provisioning (**Firefighter**) securely grants temporary permissions needed for critical production issues, such as S/4HANA downtime. **PULSE** supports both ID-based and Role-based models governed by strict duration limits and maximum usage thresholds. It automatically audits every Firefighter action at the transaction code level while enforcing absolute segregation of duties between the session Controller approving access and the Reviewer auditing post-session activity.

Utilising the Audit Assistant and Security Advisor generates instant, audit-ready summaries of active role permissions. Embedded system intelligence and usage data allow security teams to systematically identify and surgically prune dormant permissions lying across your environment. This keeps your global footprint lean, functional, and secure while protecting administration teams from burnout and maintaining strict security segmentation from day one.

Delivering continuous system activity tracking via modern dashboards replaces guesswork with real-time visibility into operational health. Breaking local-system boundaries, **PULSE** performs global compliance audits across your connected landscape and deploys predictive modeling to calculate document burn rates and Digital Access consumption, proactively alerting management well in advance of costly licensing violations or mid-contract audit penalties.

Enterprise Configuration and Lifecycle Tracking empowers users with a self-service dashboard to monitor submission statuses, distinguish approval delays from target system failures, and proactively withdraw access. Centralised master data mapping governs line manager mappings, risk definitions, and role owner assignments to eliminate orphaned requests, while forensic grid editing accelerates updates and automatically logs before-and-after values in the system's core audit ledger.
